GLib is a general-purpose utility library, which provides many useful data types, macros, type conversions, string utilities, file utilities, a mainloop abstraction, and so on. It works on many UNIX-like platforms, as well as Windows and OS X. GLib is released under the GNU Lesser General Public License (GNU LGPL). Generated by GTK-Doc V1.99

GLib Overview: GLib Reference Manual

GLib Core Application Support The Main Event Loop — manages all available sources of events Threads — portable support for

GLib Reference Manual - freedesktop.org

The GLib wrappers call the wide character API if present (on modern Windows systems), otherwise convert to/from the system code page. Another group of functions allows to open and read directories in the GLib file name encoding. These are `g_dir_open()`, `g_dir_read_name()`, `g_dir_rewind()`, `g_dir_close()`.

File Utilities: GLib Reference Manual - GNOME

GLib uses reference counting in many of its

data types, and provides the `grefcount` and `gatomicrefcount` types to implement safe and atomic reference counting semantics in new data types.

Reference counting: GLib Reference Manual

If the reference count of array is greater than one, the `GArray` wrapper is preserved but the size of array will be set to zero. If array contents point to dynamically-allocated memory, they should be freed separately if `free_seg` is `TRUE` and no `clear_func` function has been set for array. This function is not thread-safe. If using a `GArray` from multiple threads, use only the `atomic_g_array_ref` ...

Reference Manual - GNOME

Description. Memory slices provide a space-efficient and multi-processing scalable way to allocate equal-sized pieces of memory, just like the original `GMemChunks` (from `GLib 2.8`), while avoiding their excessive memory-waste, scalability and performance problems. To achieve these goals, the slice allocator uses a sophisticated, layered design that has been inspired by Bonwick's slab allocator ...

Memory Slices: GLib Reference Manual - GNOME

The general policy of `GLib` is that all functions are invisibly threadsafe with the exception of data structure manipulation

functions, where, if you have two threads manipulating the same data structure, they must use a lock to synchronize their operation. GLib
