The minimum-cost flow problem (MCFP) is an optimization and decision problem to find the cheapest possible way of sending a certain amount of flow through a flow network. A typical application of this problem involves finding the best delivery route from a factory to a warehouse where the road network has some capacity and cost associated. The minimum cost flow problem is one of the most fundamental among all flow and circulation problems because most other such problems can be cast as a minimum

Minimum-cost flow problem - Wikipedia

The minimum cost network flow problem is a linear program with a special structure. As such specialised algorithms can solve very large problems. Any problem which can be represented in the form of a picture such as shown above can be regarded as a minimum cost network flow problem (and hence easily solved).
