Thermal Recovery Of Oil And

During thermal recovery, crude oil undergoes physical and chemical changes because of the effects of the heat supplied. Physical properties such as viscosity, specific gravity and interfacial tension are altered. The chemical changes involve different reactions such as cracking, which is the destruction of carbon-carbon bonds to generate lower molecular weight compounds, and dehydrogenation, which is the rupture of

carbon-hydrogen bonds.

thermal recovery - Schlumberger Oilfield Glossary

Enhanced oil recovery, also called tertiary recovery, is the extraction of crude oil from an oil field that cannot be extracted otherwise. EOR can extract 30% to 60% or more of a reservoir's oil, compared to 20% to 40% using primary and secondary recovery. According to the US Department of Energy, carbon dioxide and water are injected along with one of three EOR techniques: thermal injection, gas injection, and chemical injection. More advanced, speculative EOR techniques are sometimes called qu

Enhanced oil recovery - Wikipedia

For over 90% of the vast resources of bitumen and heavy oil in Canada, in situ recovery processes have to be developed to produce and utilize them efficiently and economically. Thermal recovery processes using steam, although effective for thick reservoirs with good quality sands, are increasingly proving to be uneconomical, particularly for thin, shaley, or bottom water reservoirs.

Heat and steam comprise two of the thermal oil recovery methods. Using these methods enables the withdrawal of 30 to 60 percent of a reservoir's total oil reserves. Thermal Oil Recovery. While chemical techniques account for only about one percent of enhanced US production, gas injection comprises about 60 percent and thermal recovery accounts for 40 percent.

Some production fields use more than one method, so the percentage equals greater than 100 percent.

Thermal Recovery Of Oil And Bitumen - securityseek.com

Thermal recovery: Underground hydrocarbons are ignited, which creates a flame front or heat barrier that pushes the oil toward the well. • Recirculated gas drive: Natural gas or carbon dioxide (CO₂) is reinjected to mix with the underground oil, to free it from the reservoir rock. The gas is reclaimed and recirculated back into the reservoir until it is economically nonproductive (i.e., the recovery rate is marginal).

Steam injection is an increasingly common method of extracting heavy crude oil. It is considered an enhanced oil recovery method and is the main type of thermal stimulation of oil reservoirs. There are several different forms of the technology, with the two main ones being Cyclic Steam Stimulation and Steam Flooding. Both are most commonly applied to oil reservoirs, which are relatively shallow and which contain crude oils which are very viscous at the temperature of the native underground forma
