-5 V low drop linear voltage regulator ...

This is the formula we can use for choosing the resistor value we need to get any voltage we want. So back to our circuit, if we have 5 volts and want 3V from it, we use the formula above. If we use a 10KΩ as our R 1 resistor, plugging in the values, we get $R_2 = (V_{OUT}) / (V_{IN} - V_{OUT}) = (3V) / (5V - 3V) = 15K\Omega$.

How to Reduce Voltage with Resistors

The device is a 5-V low drop fixed voltage regulator. The maximum input voltage is 42 V (65 V, ≤ 400 ms). Up to an input voltage of 26 V and for an output current up to 550 mA it regulates the output voltage within a 2%

accuracy. The short circuit protection limits the output current of more than 650 mA. The IC can be switched off via the inhibit input.
