Recombinant DNA Principles and Methodologies - 1st Edition ...

Recombinant DNA technology is the joining together of DNA molecules from two different species. The recombined DNA molecule is inserted into a host organism to produce new genetic combinations that are of value to science, medicine, agriculture, and industry. Since the focus of all genetics is the gene, the fundamental goal of laboratory geneticists is to isolate, characterize, and manipulate genes.

The principle of recombinant DNA technology involved four steps. The four steps are: (1) Gene Cloning and Development of Recombinant DNA (2) Transfer of Vector into the Host (3) Selection of Transformed Cells and (4) Transcription and Translation of

Inserted Gene.

Principle of Recombinant DNA Technology (4 Steps)

The plasmid containing the inserted DNA segment will replicate in host cells. Basic recombinant DNA techniques – molecular cloning of a gene segment into a plasmid vector. Cutting a plasmid and foreign DNA fragments with a restriction enzyme (e.g., EcoRI) generates “sticky ends”.

Q.5. Mention any three vector-less methods that are used to introduce recombinant DNA into a competent host cell. A.5. The three vector-less methods include: Transformation: This is the process by which bacteria takes up the genetic material directly from the surroundings. For this, the bacterial cells are treated with calcium chloride.
