Two sets of seakeeping computations and comparative model tests were performed for a fast monohull in regular waves. The first set of computations used an existing three-dimensional frequency domain panel code that formulates the potential flow problem by means of the zero-speed Green function. The second set used a modified version of this code that implemented an advanced software module, newly developed within the European research project WAVELOADS, where the free-surface forward-

The objective of this paper is to compare hull resistance and seakeeping ability between monohull and semi-SWATH by means of prediction. Predictions were done by using simulation method for both analyses. The prediction of hull resistance and seakeeping of vessel is essential in early stage of design.

HULL RESISTANCE AND SEAKEEPING OF MONOHULL AND SEMI- SWATH

A number of factors affect seakeeping or how correctly the ship responds. Size: A larger ship will generally have lower motions than a smaller one. This is because the relative size of the waves is lower. Displacement : A heavier ship will generally have lower motions than a lighter one. Given that the wave energy is the same for each vessel and provides the exciting force, the one with the greater mass will have the lower accelerations.

Seakeeping - Wikipedia

This thesis describes a comparative study of seakeeping analysis for a fishing vessel in Malaysia. Three different methods were used for the seakeeping analysis namely; full scale trial, model experiments and time domain simulation. The simulation program was developed at Universiti Teknologi Malaysia (UTM).
