This type of chromosome mutation is called translocation. Even though the gene is not completely lost, this mutation can cause serious problems by having the genes encoded on the wrong chromosome. Some traits need nearby genes to induce their expression. If they are on the wrong chromosome, then they do not have those helper genes to get them started and they will not be expressed. Also, it is possible the gene was not expressed or inhibited by nearby genes.

4 Types of Chromosome Mutations -Evolution and Genetics

The abnormal gene may be inherited or may arise spontaneously as a result of a new mutation. Gene abnormalities are fairly common. Humans carry an average of 100 to 400 abnormal genes.
