Solution To Cubic Polynomial

The cubic formula is the closed-form solution for a cubic equation, i.e., the roots of a cubic polynomial. A general cubic equation is of the form $z^3 + a_2 z^2 + a_1 z + a_0 = 0$ (1) (the coefficient a_3 of z^3 may be taken as 1 without loss of generality by dividing the entire equation through by a_3). The Wolfram Language can solve cubic equations exactly using the built-in command `Solve[a3 x^3 + a2 x^2 + a1 x + a0 == 0, x]`.

Cubic Formula -- from Wolfram MathWorld

$p = -b / (3a)$, $q = p^3 + (bc - 3ad) / (6a^2)$, $r = c / (3a)$ But I do not recommend that you memorize these formulas. Aside from the fact that it's too complicated, there are other reasons why we don't teach this formula to calculus students. One reason is that we're trying to avoid teaching them about complex numbers.

Now let us move on to the solution of cubic equations. Like a quadratic, a cubic should always be re-arranged into its standard form, in this case $ax^3+bx^2+cx+d = 0$ The equation $x^2+4x-1 = 6x$ is a cubic, though it is not written in the standard form.

We observe that a cubic polynomial can have at the most four terms. A cubic polynomial, in general, will be of the form $\left(x^3 + ax^2 + bx + c \right)$, where $a, b, c \in \mathbb{R}$ and $a \neq 0$. Once

again, the constraint that a should not be equal to 0 is required because if a is 0, then this becomes a quadratic rather than a cubic polynomial.
