Interphase. A cell grows and carries out all normal metabolic functions and processes in a period called G 1 (Figure \\PageIndex{1}\\). G 1 phase (gap 1 phase) is the first gap, or growth phase in the cell cycle. For cells that will divide again, G 1 is followed by replication of the DNA, during the S phase. The S phase (synthesis phase) is period during which a cell replicates its DNA.

Cell division and growth. In unicellular organisms, cell division is the means of reproduction; in multicellular organisms, it is the means of tissue growth and maintenance. Survival of the eukaryotes depends upon interactions between many cell types, and it is essential that a balanced distribution of types be maintained. This is achieved by the highly regulated process of cell proliferation.

Growth originates at the meristem of the root tip, where cell division occurs, which is covered by a slimy 'root cap' that

protects the shoot from abrasion by soil particles. Behind this zone, there is a cell 'elongation zone', where the cells begin to form two layers. The outer layer is the cortex, where nutrient uptake and storage occurs.

In multicellular organisms, tissue growth rarely occurs solely through cell growth without cell division, but most often occurs through cell proliferation. This is because a single cell with only one copy of the genome in the cell nucleus can perform biosynthesis and thus undergo cell growth at only half the rate of two cells. Hence, two cells grow (accumulate mass) at twice the rate of a ...
