C=O. 150 - 200. The C-13 NMR spectrum for but-3-en-2-one. This is also known as 3-buten-2-one (amongst many other things!) Here is the structure for the compound: You can pick out all the peaks in this compound using the simplified table above. The peak at just under 200 is due to a carbon-oxygen double bond.

Peak integration is generally not useful in ¹³C-NMR spectroscopy, except when investigating molecules that have been enriched with ¹³C isotope (see section 5.6B). The resonance frequencies of ¹³C nuclei are lower than

those of protons in the same applied field - in a 7.05 Tesla instrument, protons resonate at about 300 MHz, while carbons resonate at about 75 MHz.

We have seen that ^{13}C NMR is usually decoupled and therefore there is no splitting of signals which limits the information we can get as to how many hydrogens are connected to a carbon atom. And even combining ^1H and ^{13}C NMR spectra may not give a definite evidence for choosing only one structure.

DEPT NMR: Signals and Problem Solving - Chemistry Steps

Next functional group recognizable in ^1H NMR spectroscopy is the ~ 10 ppm signal of aldehydes. Usually, it shows up as a singlet,

though splitting with adjacent protons is not uncommon either: Another way of identifying aldehydes and ketones as well as checking for a ~200 ppm signal on the ^{13}C NMR. Esters and carboxylic acids appear less downfield - 160-180 ppm.
