Input Filter Design for Switching Power Supplies

The input filter on a switching power supply has two primary functions. One is to prevent electromagnetic interference, generated by the switching source, from reaching the power line and affecting other equipment. The second is to prevent high-frequency voltage on the power line from passing through the output of the power supply.

Input-Filter Design for Switching Regulators
Abstract: The interaction between the input filter and the control loop of switching regulators often results in detrimental effects, such as loop instability, transient response, and audio-signal-rejection rate, etc. A small-signal average model is derived to investigate these

effects.

It is nearly always required that a filter be added at the power input of a switching converter. By attenuating the switching harmonics that are present in the converter input current waveform, the input filter allows compliance with regulations that limit conducted electromagnetic interference (EMI). The input filter can also protect the converter and its load from transients that appear in the input voltage $v_g(t)$, thereby improving the system reliability.

This article discusses a practical approach to

designing an input filter to the switch-mode power supply (SMPS). The approach is based on the concept of negative input resistance that a SMPS presents to the filter when operated in a feedback configuration.

Analytical discussion is followed by simulation and measurement results from a practical filter/SMPS implementation.

Input filters are widely used in power design. They have two main purposes: one is to suppress the noise and surge from the front stage power supply, another is to decrease the interference signal at switching frequency

and its harmonic frequency to go back to the power supply and interfere other devices which uses the power supply.

Analysis and Design of Input Filter for DC-DC Circuit

The input filter inductor is basically a straight-forward design. There are four parameters required to achieve a good design: (1) required inductance, (2) dc current, (3) dc resistance, and (4) temperature rise. The requirement for the input inductor is to provide a low ac ripple current to the source.
