Abstract. The latest advancement in neurobiological research provided an increasing evidence that inflammatory and neurodegenerative pathways play a relevant role in depression. Preclinical and clinical studies on depression highlighted an increased production of inflammatory markers, such as interleukin (IL)-1, IL-6, tumor necrosis factor- α and interferon- α and γ .

Neurodegenerative diseases (ND) can be characterized by degradation and subsequent loss of neurons. ND has been identified as the leading cause of disability-adjusted life years (DALYs) worldwide and is associated with various risk factors such as ageing, certain genetic polymorphisms, inflammation, immune and metabolic conditions that may induce elevated reactive oxygen species (ROS) release ...

Neurodegenerative diseases (ND), including Alzheimer's disease (AD), amyotrophic lateral sclerosis (ALS), and Parkinson's disease (PD), have emerged as a major public health problem worldwide with ageing. However, the complexity of ND in its biological, genetic, and clinical aspects has hindered the development of effective therapeutic agents.

The inflammatory & neurodegenerative (I&ND) hypothesis of ...

MS is an inflammatory demyelinating disease of the central nervous system (CNS) due to autoimmune aggression against myelin and neuronal antigens [29]. MS onset is usually between 20 and 40 years of age and, in most cases, the disease displays a chronic evolution leading to substantial disability [30].

Immunity and inflammation in neurodegenerative diseases

Neuroinflammation is a process related with the onset of several neurodegenerative disorders and it is an important contributor to AD pathogenesis and progression. Several damage signals appear to induce neuroinflammation, such as trauma, infection, oxidative agents, redox iron, oligomers of tau, and A β .

Inflammation drives the progression of neurodegenerative ...

In a subtype of MS, Devic's neuromyelitis optica, the pathology is often described as neurodegenerative rather than inflammatory, and antibody plays a critical role (Lucchinetti et al., 2002). Therefore, although particular myelin antibodies may have a beneficial role in neuroprotection, it is generally accepted that myelin antibodies are involved in demyelination and disease pathogenesis in MS.
