Myers' theorem, also known as the Bonnet-Myers theorem, is a celebrated, fundamental theorem in the mathematical field of Riemannian geometry.It was discovered by Sumner Byron Myers in 1941. It asserts the following: Let (M,g) be a complete Riemannian manifold of dimension n whose Ricci curvature satisfies $\text{Ric} \geq (n-1)g$ for some positive real number c . Then any two points of M can be joined by a ...

As a conclusion, we obtain, among other things, the Theorem of Cartan-Hadamard which is a fundamental result about the structure of complete Riemannian-manifolds of nonpositive sectional curvature. In Chapter 4, we prove the Morse Index theorem which states that the index of the Index form along a geodesic γ equals the number of conjugate points along γ , each counted with its multiplicity.

It follows easily that any curve from p to the boundary of $B_r(p)$ has length at least λr , where λ is the minimum of $\lambda(x)$. However, given $q \in B_r(p)$, we may assume that r has been chosen sufficiently small so that $q \in B_{r/2}(p)$. Then any curve from p to q must contain an initial segment from p to the boundary of $B_{r/2}(p)$.
