Quantifying Cell Migration In Real Time Using The Oristm

Although it is widely appreciated that cells migrate in a variety of diverse environments in vivo, we are only now beginning to use experimental workflows that yield images with sufficient spatiotemporal resolution to study the molecular processes governing cell migration in 3D environments. Since cell migration is a dynamic process, it is usually studied via microscopy, but 3D movies of 3D ...

Quantifying Modes of 3D Cell Migration: Trends in Cell Biology

The acquisition of a migratory EVT phenotype, and the subsequent ability of these cells to invade the decidua does not result from one discrete differentiation event that can be directly measured, but rather is a continuous and complex process involving multiple changes in adhesion molecules and secreted proteases that is regulated by a large number of interacting cytokines arising from multiple cell types at the materno-fetal interface. 9 In order to better understand and quantify the ...

Three-dimensional (3D) migration assay. Cell migration ability was analyzed utilizing polycarbonate membrane inserts with an 8 µm pore size (CytoSelect™ 24-well cell migration assay, Cell Biolabs, Inc. CA, USA). Serum-free media were placed on top of the polycarbonate membrane, and culture media were placed under the membrane.

Biomarkers to quantify cell migration characteristics ...

In vitro assays are central to the study of cell migration since they allow us to quantify cell migratory capacity under controlled experimental conditions [3, 4]. The scratch or wound healing assay is the method of choice for studying cell migration due to the low cost and simplicity of its experimental design [4, 5].

For single-cell migration, we focus on measures and models giving examples of biological systems where they have been applied, for example, migration of bacteria, fibroblasts, and immune cells. For collective migration, we describe the model systems wound healing, neural crest migration, and Drosophila gastrulation and discuss methods for cell migration within these systems.

estimator to quantify how much the cell migration dynamics deviates from that of a Brownian motion or ballistic motion. Our analysis indicates that the combination of Shannon entropy and wavelet transform offers an efficient tool to estimate the persistence of cell migration, which may also reflect the real-time effects of ICSP-ECM to some extent.

Shannon Entropy for Time-Varying Persistence of Cell Migration

Cell migration into the Detection Zone was measured by counting cell number using ImageJ analysis software (version 1.42I). First, the threshold was set for each grayscale image (Image-> Adjust-> Threshold). By selecting “Apply” in the threshold window, the thresholded image was converted to a binary image.

Migration can be assessed by determining the number of cells that move across a microporous membrane (transwell migration assay) or by measuring the surface area that cells occupy over time after creating a ‘cell-free’ area (scratch assay) [8-10].
