Exercise 3.1-2. Show that for any real constants a and b , where $b > 0$, $(n + a)^b = \Theta(n^b)$. To prove this, we have to show that there exists constants $c_1, c_2, n_0 > 0$ such that $0 \leq c_1 n^b \leq (n + a)^b \leq c_2 n^b$ for all $n \geq n_0$. As $b > 0$, we can raise all the terms of the previous inequality to the power of b without breaking the inequality:

CLRS - Exercise 3.1-2

We can design any algorithm to treat its best-case scenario as a special case and return a predetermined solution. For example, for selection sort, we can check whether the input array is already sorted and if it is, we will not do anything. So, selection sort will run with a best-case running time of $\Theta(n)$.
