Deep excavation and geotechnical construction methods Construction method selection for deep excavations depends on many factors. Local experience plays always an important role as local knowledge typically dictates the limitations of what can be built successfully in the field.

### Deep excavation construction methods - Deep Excavation

In current construction practice, a top-down construction method has been gradually adopted for most high-rise projects. It is used to reduce the duration of the overall construction schedule. This new construction sequence allows the construction of the building superstructure together with the ground excavation and basement construction.

### Deep Excavation - an overview | ScienceDirect Topics

In construction terms, excavation is the process of removing earth to form a cavity in the ground. On small sites or in confined spaces, excavation may be carried out by manual means using tools such as picks, shovels and wheelbarrows. Larger scale excavation works will require heavy plant such as bulldozers and backactors.

### Types of excavation - Designing Buildings Wiki

Shallow excavations are defined as being anything less than 1.5 metres deep, which really is not very deep at all; a relatively short person could comfortably see over the top. Deep excavations, on the other hand, are

defined as being any excavation which is more than 4.5 metres in depth – a considerable height indeed.

### **TOP TO DOWN CONSTRUCTION METHOD - Advance Civil engineering**

Deep excavations in urban areas need to limit ground movements for the protection of surrounding property and generally have limited space for construction. Top-down construction addresses both issues. Lateral earth support is provided by progressively excavating and constructing permanent robust supporting structures and the completed decks provide working space. For the majority of underground railway stations bottom-up construction has been adopted.
