Distance Protection Of Transmission Line
Distance Protection is a Non-unit System of Protection, which measures the Impedance between the Relay Location and the point where the fault is incident and compares it with the Set Value. If the measured Impedance is less than the Set Value, the Relay operates and Isolates the Faulty Section.

Transmission Line Distance Protection Explained in detail
Distance Protection- Transmission Line Principle: Distance Protection is a Non-unit System of Protection, which measures the Impedance between the Relay Location and the point where the fault is incident and compares it with the Set Value. If the measured Impedance is less than the Set Value , the Relay operates and Isolates the Faulty Section.

Distance Protection- Transmission Line - A B C of ...
Protection of Transmission lines (Distance Protection) By, Rohini Haridas Assistant Professor, Dept of Electrical Engineering, SSGM College of Engineering,Shegaon 2. As the length of electrical transmission line is generally long enough and it runs through open atmosphere, the probability of occurring fault in electrical power transmission line is much higher than that of transformers and alternators .

Protection of transmission lines (distance)
Introduction to Distance Protection. Distance relays are one of the most important protection elements in a transmission line. Principles and Characteristics of Distance Protection. These relays may sometimes be set based in percentages of the line impedances, for example a typical setting for zone 1 is 80% of the impedance of the line in order to not reach the remote end, the zone 2 can be set at 120% of the impedance of the line in order to dependably overreach the line, Zone 3

Principles and Characteristics of Distance Protection
Because, impedance is a complex number, the distance protection is inherently directional. The first quadrant is the forward direction i.e. impedance of the transmission line to be protected lies in this quadrant. However, if only magnitude information is used, non-directional impedance relay results.

Line Protection | Schweitzer Engineering Laboratories
Distance protection Differential protection is mainly used on short overhead lines and distance protection on long overhead lines. The distinction between short and long overhead lines is based on a comparison between the inductance and the resistance and capacitance of the overhead line.

Overhead Lines Protection - Faults and Protection Devices
-We use distance protection in many transmission lines. In order to increase operating speed. we may use a communications channel to exchange information between directional or distance elements. This type of arrangement is directional comparison pilot protection.

Transmission and distribution lines protection
Hence, it can be said that the relay will only operate when the impedance of the line becomes less than predetermined impedance (voltage/current). As the impedance of a transmission line is directly proportional to its length, it can easily be concluded that a distance relay can only operate if fault is occurred within a predetermined distance or length of line. Types of Distance or Impedance Relay. There are mainly two types of distance relay- Definite distance relay. Time distance relay ...

Distance protection is therefore used for the protection of Transmission Line. It is simple to apply and fast in isolating the faulty section from the healthy network. Distance Protection provides primary as well as back-up protection to the protected line. I will show this back-up protection function latter in this post.
