In general three phase loads are considered either “balanced” or “unbalanced”. A three phase circuit is considered balanced if the voltages, currents and power factors in all three phases are identical. Conversely, when any of these parameters are not identical the circuit is classified as unbalanced.

IEEE Std 112TM–2004 specifies the definition for unbalanced voltage as the ratio of maximum deviation (V_{m_avg}) from the average of the three-

phase voltage (V_{avg}) to the average of the three-phase voltage, expressed in percentage as shown in (1). The phase angle unbalance is not mirrored in (1) since it is based only on magnitudes.
