Virtual prototyping with simulation software allows you to identify and address signal integrity, thermal management, and even manufacturability problems in your board before you order prototypes from a manufacturer. You can reduce the number of prototyping runs when you use a circuit simulator that takes data directly from your designs.

Virtual prototyping, often known as VP, is a software-based engineering discipline which involves modelling a system, simulating and visualising its behaviour under real-world operating conditions, and refining its design through an iterative process. VP is increasingly used as a substitute for rapid prototyping. VP does not produce a physical object for testing and evaluation but, as its name suggests, carries out these tasks within a computer.

Rapid prototyping is the fast fabrication of a physical part, model or assembly using 3D computer aided design (CAD). The creation of the part, model or assembly is usually completed using additive manufacturing, or more commonly known as 3D printing. Where the design closely matches the proposed finished product it is said to be a high fidelity prototype, as opposed to a low fidelity prototype, where there is a marked difference between the

prototype and the final product.

Digital or virtual prototyping is an engineering discipline that involves modelling a part or a system using software. These digital mockups are simulated virtually to observe its behaviour under real world operating conditions. Since the entire simulation process is digital, refining of the design is easier to manage.

One alternative is the use of virtual environments. Virtual environments can support the training and observation of fire evacuee behaviours in 3D virtual

buildings. However complex virtual environments can be difficult to build. This paper explores how the reuse of computer game technology can aid in the rapid prototyping of virtual environments which can be populated with fire drill evacuation scenarios.

Virtual and Physical Prototyping: Vol 15, No 4

Virtual prototyping is a method in the process of product development. It involves using computer-aided design, computer-automated design and computer-aided engineering software to validate a design before committing to making a physical prototype. This is done by creating computer generated geometrical shapes and either combining them into an "assembly" and testing different mechanical motions, fit and function. The assembly or individual parts could be opened in CAE software to simulate the be
