ABSTRACT. The synthesis of cyclohexene from cyclohexanol is an example of elimination reaction. Cyclohexanol, a secondary unsaturated alcohol, undergoes dehydration reaction to form a good leaving group which is H_2O because the OH group of an alcohol is a very strong base making it a poor leaving group.

Synthesizing Cyclohexene from Cyclohexanol by Dehydration

The synthesis of cyclohexene from cyclohexanol is an example of elimination reaction. Cyclohexanol, a secondary unsaturated alcohol, undergoes dehydration reaction to form a good leaving group which is H_2O because the OH group of an alcohol is a very strong base making it a poor leaving group. The reaction will then be followed by the obstruction of a hydrogen atom to form

a carbon double bond or an alkene which in this case is cyclohexene.

of cyclohexanol.

Dehydration reactions are a type of elimination reaction in which water is eliminated from an alcohol. In an E1 reaction mechanism, the source of the proton comes from H_3PO_4 . The alkene is then distilled off during the course of the reaction shifting equilibrium to the product side.

The dehydration of cyclohexanol is carried out in such a way that

the product, cyclohexene, distils from the reaction mixture as it is formed, the distillation technique serves to remove the olefin from contact with the sulphuric acid before polymerization can set in and it also serves as a first stage in the eventual purification of the olefin.

In this experiment an alkene (cyclohexene) will be prepared by dehydration of an alcohol (cyclohexanol) using an acid catalyst such as phosphoric acid. This is one of the most common methods of preparing alkenes. The crude product is contaminated with water, unreacted alcohol, phosphoric

acid and some side products.

Preparation of cyclohexene from cyclohexanol.

Abstract: In this lab, cyclohexene is prepared by dehydrating cyclohexanol. At first part of the experiment, 6.0 mL of cyclohexanol is treated with sulfuric acid and phosphoric acid and a distillation. The distillate is collected at boiling temperature range of 77°C to 80°C. From a 6.0 mL of cyclohexanol, 2.29 grams of cyclohexene is produced.

The synthesis of the cyclohexene segment of portimine, a marine

cytotoxin from the dinoflagellate *Vulcanodinium rugosum*, was achieved. The route includes an acylation/aldol reaction from 3-ethoxycyclohex-2-enone to create the C3 center, the 1,4-addition of a vinyl group at C16, the diastereoselective dihydroxylation of the vinyl group to generate the C15 center, a vinylation/dehydration sequence to set up the diene moiety, and stepwise installation of the amino-group-substituted C1 unit.

Synthesis of the cyclohexene segment of portimine ...

Cyclohexene was synthesized from cyclohexanol by unimolecular elimination (E1)

through the dehydration of cyclohexanol. Phosphoric acid was used to catalyze the reaction and the unimolecular elimination was favored by heating the reaction at a high temperature and also by the use of the non-nucleophilic phosphoric acid.
