The direct answer is no, we don't cover models with categorical or count responses. In order to model a repeated measured data set with a categorical response, you're going to need to use either a GEE or a Generalized Linear Mixed Model (GLMM). But that quick answer may not tell you the whole story.

Models for Repeated Measures Continuous, Categorical, and ...

For categorical variables, regression uses binary coding (1, 0) so that you compare the results for each categorical value to a baseline value. ANOVA typically uses categorical factors. These factors will often use effects coding (1, 0, -1), which allows you to compare each factor level to the overall mean (rather than to a baseline group).

Deriving a Model for Categorical Data. Typically, when we have a continuous variable Y (the response variable) and a continuous variable X (the explanatory variable), we assume the relationship $E(Y|X) = \beta_0 + \beta_1 X$. This equation should look familiar to you as it represents the model of a simple linear regression. Here, $E(Y|X)$ is a random variable.

For instance, the R^2 for this model is 0.002, which could be computed from the ANOVA table using the regression (Model) sum of squares and the total sum of squares ($SS(sei)$): $2,002/1,002,219 = 0.002$. Recall that the R^2 is the squared value of the correlation between the predicted values and the observed values of the outcome variable.
