Wind Power Plant Collector System

The layout of the wind power plant, the size and type of conductors used, and the method of delivery (overhead or buried cables) all influence the performance of the collector system inside the wind power plant. Our effort to develop an equivalent representation of the collector system for wind power plants is an

Typical wind plant collection system voltage and KVA ratings are at the extreme end of the distribution class IEEE Standards. The wtg padmount transformer is subjected to thermal cycling that is more severe than in a typical distribution transformer as the output of the turbine is constantly changing with the wind.
