Wiener Index Of A Graph

The Wiener index , denoted (Wiener 1947) and also known as the "path number" or Wiener number (Plavšić et al. 1993), is a graph

index defined for a graph on nodes by. where is the graph distance matrix . Unless otherwise stated, hydrogen atoms are usually ignored in the computation of such indices as organic chemists usually do when they write a benzene ring as a hexagon (Devillers and Balaban 1999, p. 25).

Wiener Index -- from Wolfram MathWorld

In chemical graph theory, the Wiener index (also Wiener number) introduced by Harry Wiener, is a topological index of a molecule, defined as the sum of the lengths of the shortest paths between all pairs of vertices in the chemical graph representing the non-hydrogen atoms in the molecule.

Wiener index - Wikipedia

The Wiener index $W(G)$ of a connected graph G , introduced by Wiener in 1947, is defined as $W(G) = \sum_{u,v \in V(G)} d(u,v)$ where $d(u,v)$ is the distance between vertices u and v of G . The Steiner distance in a...

The Wiener index of a graph G , denoted by $W(G)$ is the sum of the distances between all (unordered) pairs of vertices of G . In this paper, we obtain the Wiener index of line graphs and some class of...

(PDF) On the Wiener index of a graph - ResearchGate

Abstract. A modification of the Wiener index which properly takes into account the symmetry of a graph is proposed. The explicit formulae for the modified Wiener index of path, cycle, complete

bipartite, cube and lattice graphs are derived and compared with their standard Wiener index. This is a preview of subscription content, log in to check access.

The Wiener index of a graph $G=(V,E)$, denoted by $W(G)$, was introduced in 1947 by chemist Harold Wiener as the sum of distances between all vertices of G : $W(G)=\sum_{\{u,v\} \subseteq V(G)} d(u,v)$. The first and the second Zagreb indices were introduced more than thirty years ago by Gutman and Trinajstić.

Wiener index of some graph operations - ScienceDirect

The Wiener index of the graph G , denoted by $W = W(G)$, is the sum of distances between all pairs of vertices of G . The Wiener index of graphs has been studied in much detail (see the reviews , , , the recent papers , , , , , , and the references cited therein). Yet, Wiener indices of Eulerian graphs seem to have evaded the attention of scholars.

Wiener index of Eulerian graphs - ScienceDirect

The Wiener index of a connected graph is the sum of the distance of all pairs of distinct vertices. It was introduced by Wiener in 1947 to analyze some aspects of branching by fitting experimental data for several properties of alkane compounds. Denote by $\mathcal{U}_n$, $\mathcal{U}_n^r$ the set of unicyclic graphs with n vertices and r vertices of even degree.

The Wiener index is a topological index of a molecular graph, defined as the sum of distances between all pairs of its vertices. Benzenoid graphs include molecular graphs of polycyclic aromatic hydrocarbons. An edge thorny graph G is constructed from a catacondensed benzenoid graph H by attaching new graphs to edges of a perfect matching of H .

The Wiener index is a well-known distance-based topological index introduced as structural descriptor for acyclic organic molecules [17]. It is defined as the sum of distances between all unordered pairs of vertices of a simple graph G , i.e., $W(G) = \sum_{\{u,v\} \subseteq V(G)} d(u,v) = \frac{1}{2} \sum_{v \in V(G)} d_G(v)$.
