Obtaining a Converged Solution with Abaqus

Since the coupled equations of the multiphysics system may be ill conditioned (e.g., the thin shell structure coupling with water), it is difficult to get a converged solution by iterative solver, or at least a considerable number of

iterations are needed to get a converged solution. Instead of using a parallel iterative solver, the distributed parallel direct sparse solver is more robust and efficient.

e) Try constraining different nodes to

remove rigid body motion as both the nodes and constraints can have a large influence in obtaining a converged solution. As long as the constraint is properly applied to eliminate all rigid body rotation and translation modes, the final results will be very similar.

Automatic Meshing avoids the necessity to spend hours optimizing meshes, and CONWIZ, the convergence wizard, greatly reduces the complexity of obtaining converged solutions. Both steady-state and transient (time-dependent) scenarios can be considered, enabling users to extend the range of conditions applied to their models.

First, it should be clear that no obstacles exist to adding explicit diffusion to any scheme: to the degree that an identical set of partial differential equations is being solved, with identical initial and boundary conditions, and that

numerically converged solutions are computed, any scheme should be able to reproduce the results presented in the paper. Second, if our initial conditions are integrated with no explicit diffusivity, it is highly unclear, in our opinion, what an implicitly ...
