In mathematics, the Euclidean algorithm, or Euclid's algorithm, is an efficient method for computing the greatest common divisor (GCD) of two integers (numbers), the largest number that divides them both without a remainder. It is named after the ancient Greek mathematician Euclid, who first described it in his Elements (c. 300 BC). It is an example of an algorithm, a step-

ABSTRACT. An algorithm is presented for finding a maximum-weight spanning tree of a set of n points in the Euclidean plane, where the weight of an edge (p_i, p_j) equals the Euclidean distance between the points p_i and p_j . The algorithm runs in time $O(n \log n)$ and requires $O(n)$ space. If the points are vertices of a convex polygon (given in order along the boundary), then our algorithm requires only a linear amount of time and space.

element in the matrix represents the squared Euclidean distance (see Sec.3 for the non-square case)¹, a calculation that frequently arises in machine learning and computer vision. The distance matrix is defined as follows: $D_{ij} = \sum_k (x_i - x_j)^2 = \sum_k (x_i^2 - 2x_i x_j + x_j^2) = \sum_k x_i^2 - 2x_i \sum_k x_j + \sum_k x_j^2$ (1) or equivalently, $D_{ij} = (x_i - x_j)^T (x_i - x_j) = x_i^T x_i - 2x_i^T x_j + x_j^T x_j$ (2)

In mathematics, the Euclidean distance

between two points in Euclidean space is a number, the length of a line segment between the two points. It can be calculated from the Cartesian coordinates of the points using the Pythagorean theorem, and is occasionally called the Pythagorean distance. These names come from the ancient Greek mathematicians Euclid and Pythagoras, but Euclid did not represent distances as numbers, and the connection from the Pythagorean theorem to distance calculation was no
