In traditional geometry, affine geometry is considered to be a study between Euclidean geometry and projective geometry. On the one hand, affine geometry is Euclidean geometry with congruence left out; on the other hand, affine geometry may be obtained from projective geometry by the designation of a particular line or plane to represent the points at infinity.

If the field has a prime power number of elements n , then the affine plane has order n , that is, n points on a line. The associated projective plane has order n with $n + 1$ points on each line. You can verify that the real projective plane obeys the axioms for a projective plane.

The goal of the present paper is to lay the foundations for a theory of projective and affine structures on higher-dimensional varieties in positive characteristic. This theory deals with Frobenius-projective and Frobenius-affine structures, which have been previously investigated only in the case where the underlying varieties are curves. As the first step in expanding the theory, we prove ...

Affine Line extended with its ideal element serves as a model for 1-dimensional Projective Geometry. Projective Geometry differs from its extended Affine counterpart in that it makes no distinction between ordinary and ideal elements. 1-dimensional Projective Geometry with one point marked, is modeled by the extended line.

So indeed "projective varieties are locally affine": they are covered by open sets which are affine varieties. This is a very fruitful point of view. This is a very fruitful point of view. We will call $X \cap U_i \subset \mathbb{A}^n$ the affine charts of the projective variety $X \subset \mathbb{P}^n$.
