Evapotranspiration-based irrigation scheduling or water-balance method The status of the soil water for an irrigated crop needs monitoring regularly to assist the irrigation manager in making irrigation decisions. Typically, irrigation scheduling can be done in two ways. One is by directly monitoring soil-water by using soil moisture sensors.

It incorporates many years of user experience with the previous report and recent advances in the physics of evaporation from plant and soil surfaces.

Evapotranspiration and Irrigation Water Requirements
EVAPORATION AND EVAPOTRANSPIRATION. Overview and Basic Definitions. Evaporation is the process where liquid water undergoes a phase change to water vapor and disappears into the atmosphere. Sublimation is a similar process involving the solid phase, ice or snow, that vaporize and become airborne.

EVAPORATION AND EVAPOTRANSPIRATION
Overall, this uptake of water at the roots, transport of water through plant tissues, and release of vapor by leaves is known as transpiration. Water also evaporates directly into the atmosphere from soil in the vicinity of the plant. Any dew or droplets of water

present on stems and leaves of the plant eventually evaporates as well.

The evapotranspiration of a crop is the total amount of soil water used for transpiration by the plants and evaporation from the surrounding soil surface. In other words, the crop evapotranspiration represents the amount of water utilized by the crop and its environment.

CHAPTER 4 - RAINFALL AND EVAPOTRANSPIRATION

The sum of evaporation and transpiration is evapotranspiration (ET). ET, which some landscapers refer to as 'plant sweat,' has been used by farmers for decades to more efficiently irrigate crops. In recent years, landscapers are adopting ET as a precise way to manage landscape irrigation, as well.

Evapotranspiration | Component of Smart Irrigation

A large part of the irrigation water applied to agricultural lands (Figure 1) is consumed by evaporation and transpiration. In field measurements, it is a very difficult and expensive task to separate evaporation from transpiration, and the two evaporative loss processes are usually considered together as ET.
