1Multiple-input multiple-output (MIMO). 2The earliest study on MIMO dates back to 1970s (A.R. Kaye, D.A. George and W. van van Etten). Jack Winters at Bell Laboratories and Jack Salz at Bell Labs published papers on beamforming in the mid 1980s. 3Paulraj and Kailath proposed the concept of Spatial Multiplexing using MIMO in 1993.

Wireless Communications Chapter 8. MIMO

Slot antennas are popular microwave antennas typically used at frequencies from 300 MHz to 24 GHz. They are widely used in radar navigation and as sector antennas in mobile communications. These antennas have omnidirectional radiation pattern and linear polarization.

Faculty of Electrical Engineering

- Slot antenna: a slot is cut from a large (relative to the slot length) metal plate.
- The center conductor of the feeding coaxial cable is connected to one side of the slot, and the outside conductor of the cable - to the other side of the slot.
- The slot length is some $(\lambda/2)$ for the slot antenna and $(\lambda/4)$ long for the INF antenna.

The proposed antenna is dually polarized. The printed dipole and the slot antenna provide dual orthogonal polarizations. The dimensions and current distribution of the dual polarized wearable antenna are presented in figure 8.1. The antenna's dimensions are $26 \times 6 \times 0.16$ cm. The antenna may be used as a wearable antenna on a human body.

A slot antenna consists of a metal surface, usually a flat plate, with one or more holes or slots cut out. When the plate is driven as an antenna by an applied radio frequency current, the slot radiates electromagnetic waves in a way similar to a dipole antenna. The shape and size of the slot, as well as the driving frequency, determine the radiation pattern.
