Single-cell analysis allows one to isolate single nuclei (Evrony et al., 2012) that can then be subjected to amplification followed either by microarray or low-coverage WGS for CNV analysis. The most common method of amplifying DNA from single cells is multiple displacement amplification (MDA) (Dean et al., 2002; Rodrigue et al., 2009). A major technical challenge is uneven amplification across the genome, which leads to inaccurate identification of CNVs.
