GEOSYNTHETIC REINFORCED SOIL

An approach for stability analysis of geosynthetic reinforced earth structures over firm foundations is presented. The approach involves both internal and external stability analyses. The internal stability analysis is based on variational limiting equilibrium and satisfies all equilibrium requirements. Two extreme inclinations of reinforcement tensile resistance are investigated: orthogonal to the radius defining the geosynthetic sheet, and horizontal, signifying the as-installed position.

The block of soil is stabilized by introducing reinforcement layers into the soil mass behind the facing units. The larger the stabilized soil mass, the more soil can be retained or held back. The geosynthetic reinforcement in the soil extends past the theoretical failure plane and serves to create a large rectangular mass of block and soil, restraining the retained soil.

Retaining Wall Design: Backfill & Geosynthetic Reinforcement

A reinforced soil wall was needed to support the massive loads on the hillside location. The working platform design used two strengths of geogrids from Strata Geosystems (120 and 60 kN/m). This approach enabled the site crews to utilized site-won material as part of the cut-and-fill balance and to minimize the amount of fill that would be needed.

GRS: Geosynthetic Reinforced Soil (GRS) is alternating layers of compacted granular fill reinforced with geosynthetic reinforcement (e.g., geotextiles, geogrids). The primary reinforcement spacing in GRS is equal to 8 in. Facing elements can be frictionally connected to the reinforcement layers to form the outer wall.
