The alpha Stirling has two power pistons, separate hot and cold heat exchangers, a regenerator, and a flywheel. The hot side heat exchanger contains a piston and the cold side heat exchanger contains a piston. Typically no displacer is used. There is usually a high temperature difference between the two pistons.

There is a lot of information on a very detailed 100W inline alpha stirling engine that was originally intended for solar use. It appears to be a master's thesis or sorts.

Alpha Stirling Engines The first type I'm going to talk about is the Alpha Stirling engine. This type has two separate cylinders, one that is heated and one that is cooled, attached together by a pipe behind the piston. The Stirling Engine (Alpha Configuration) A fixed amount of air, or other working fluid, is enclosed within two cylinders, one hot and one cold, and shuttles forwards and back wards between the two. The air is heated and expands in the hot cylinder and is cooled in the cold cylinder where it contracts, giving up its energy to perform mechanical work in the process.

CNCCookbook: Stirling Engine Models

The mechanical configurations of Stirling engines are generally divided into three groups known as the Alpha , Beta , and Gamma arrangements. Alpha engines have two pistons in separate cylinders which are connected in series by a heater, regenerator and cooler. Both Beta and Gamma engines use displacer-piston arrangements, the Beta engine having both the displacer and the piston in an in-line cylinder system, whilst the Gamma engine uses separate cylinders.

A Stirling engine is a heat engine operating by cyclic compression and expansion of air or other gas, the working fluid, at different temperature levels such that there is a net conversion of heat energy to mechanical work.[1][2] Or more specifically, a closed-cycle regenerative heat engine with a permanently gaseous working fluid, where closed-cycle is defined as a thermodynamic system in ...
