Flow And Transport In Porous

Transport in Porous Media publishes original research on the physical and chemical aspects of transport of extensive quantities such as mass of a fluid phase, mass of a component of a phase, momentum and energy, in single and multiphase flow in a (possibly deformable) porous medium domain.

Flow and transport dynamics in fractured porous media driven by enhanced oil recovery, including injection of seawater for water flooding, cold water injection into geothermal reservoirs, microbial enhanced oil recovery, alkaline flooding, low salinity water flooding, and other secondary and tertiary recovery cases.

Flow and Transport Dynamics in Fractured Porous Media ...

Holstad used a mixed FEM and FVM for two-dimensional temperature-driven flow in porous media. A mixed form of the governing flow and transport equations is constructed by a weighted-integral formulation with vectorial test and basis functions having the properties of the so-called Raviart-Thomas space, $\mathbf{RT}_0$. A mixed FEM naturally results in a directly coupled matrix system with fluxes as primary variables which significantly increases the number of unknowns.

Variable-density flow and transport in porous media ...

Multiphase flow and transport of compositionally complex fluids in geologic media is of importance in a number of applied problems which have major social and economic effects. In petroleum reservoir engineering, efficient recovery of energy reserves is the principal goal.

Multiphase flow and transport in porous media - Parker ...

Abstract Derivation of equations governing flow, heat, and mass transfer in porous media is discussed. The starting point is Darcy's law that can be gradually extended to higher flow rates and porosity, leading to the non-Darcy form of the momentum equation.

In this standard reference of the field, theoretical and experimental approaches to flow, hydrodynamic dispersion, and miscible displacements in porous media

and fractured rock are considered. Two different approaches are discussed and contrasted with each other.

The fluid flow affects the compressibility of the porous medium, while changes in volumetric strains will in turn affect the momentum, material, and heat transport. To employ these effects, the Poroelasticity multiphysics interface includes an expression of the stress tensor, as a function of the volumetric strain, and the Biot-Willis coefficient.

Examples of natural porous media and corresponding processes are flow of oil, gas, and water in oil reservoirs; the potential mobilization of methane in gas hydrates; the flow of Non-Aqueous Phase Liquids (NAPLs) in contaminated

aquifers; the storage of CO₂, nuclear waste, other hazardous wastes, and heat in the subsurface; the flow of fluids and solutes in biological tissues; and melting and metamorphism of snow.

Theory and Applications of Transport in Porous Media

The multiphase flow capabilities include transport of multiple immiscible phases through a porous medium, solving for averaged phase volume fractions. For variably saturated porous media, a nonlinear flow option, based on Richards' equation, can be used to analyze media where the hydraulic properties change

as fluids move through the porous medium, filling some pores and draining others.
