We can find the third side of the triangle by using the Pythagorean Theorem. $a^2 + 5^2 = 8^2$ $a^2 + 25 = 64$ $a^2 = 39$. $a = \sqrt{39} \approx 6.24$. When solving problems of this type, I encourage people to use the most accurate values that are available in the problem. This way, there is less chance for rounding error to occur.

$\sin(A) = \frac{a}{c}$, $\cos(A) = \frac{b}{c}$, $\tan(A) = \frac{a}{b}$, $\csc(A) = \frac{c}{a}$, $\sec(A) = \frac{c}{b}$, $\cot(A) = \frac{b}{a}$. In order to solve a right triangle, you must first figure out which angle is the right angle. Knowing the right angle will also tell you which side is the hypotenuse, since the hypotenuse will always stand opposite the right angle.

SOLVING RIGHT TRIANGLES . This is a topic in traditional trigonometry. It does not come up in calculus. To SOLVE A TRIANGLE means to know all three sides and all three angles. When we know the ratios of the sides, we use the method of similar figures. That is the method to use when solving an isosceles right triangle or a 30° - 60° - 90° triangle.

Solving right triangles. Topics in trigonometry.

Examples include: 3, 4, 5; 5, 12, 13; 8, 15, 17, etc. Area and perimeter of a right triangle are calculated in the same way as any other triangle. The perimeter is the sum of the three sides of the triangle and the area can be determined using the following equation: $A = \frac{1}{2}ab$.

Problem : Solve the following right triangle, in which $C = 90^\circ$: $A = 40^\circ$, $B = 50^\circ$. This triangle cannot be solved. Three angles is not sufficient information to determine a unique triangle. Problem : Solve the following right triangle, in which $C = 90^\circ$: $b = 6$, $B = 72^\circ$. $A = 90^\circ - B = 18^\circ$. $a = b \tan(A) = 1.9$. $c = 6.3$.
