This book grew out of the author's notes from his course on Radiative Processes in High Energy Astrophysics. The course provides fundamental definitions of radiative processes and serves as a brief introduction to Bremsstrahlung and black body emission, relativistic beaming, synchrotron emission and absorption, Compton scattering, synchrotron self-compton emission, pair creation and emission.

1.5 Radiative energy density We can define it as the energy per unit volume produced by a luminous source, but we have to specify if it is per unit solid angle

or not. For simplicity consider the bolometric intensity I . Along the light ray, construct the volume $dV = c dt dA$ where dA (i.e. one cm^2) is the base of the little cylinder of height $c dt$.

The non-radiative pathway shown in Figure 14 is the mechanism that is typically used in most textbooks to represent energy transfer processes. Non-radiative energy transfer processes

occur via two major mechanisms, the Förster resonance mechanism and the Dexter exchange mechanism.

These are a collection of lectures

covering topics in an introductory graduate astrophysics course on radiative processes. The subject matter is loosely drawn from Radiative Processes in Astrophysics by Rybicki & Lightman. At the end of the semester, each student will develop one new lecture on a subject of their choice to add to this website.

Radiative Processes in Astrophysics - AstroBaki

Instantaneous photon emission due to an ion-atom collision becomes important when the velocity or the charge of an incident ion is very high, in which case the energy of the emitted photon is high. The reason for the importance is that the probability (rate) of photon emission is proportional to the density of the final

state (photon momentum space), which increases in proportion to the square of the photon energy.
