Biology Study Guide Plant Cells

Plant cells vary in size from about 7 μm —the diameter of dividing cells at the tips of roots and shoots—to fiber cells a few micrometers wide but a meter or more in length. Most plant (and animal) cells are between 10–100 μm and thus too small to be seen without magnification since human eyes have a resolving power (resolution) of about 100 μm .

Plant cells can be larger than animal cells. The normal range for an animal cell varies from 10 to 30 micrometers while that for a plant cell stretches from 10 to 100 micrometers. Beyond size, the main structural differences between plant and animal cells lie in a few

additional structures found in plant cells.

Cell Differences: Plant Cells | SparkNotes

Cell expansion in animal cells is quite different from cell expansion in plant cells. Animal cells grow by synthesizing a protein-rich cytoplasm, a metabolically expensive process. While growing plant cells add some organic material to their cytoplasm, water uptake by the large central vacuole accounts for 90% of a plant cell's expansion.
