Lab 6 Work And Energy

L6-2 Lab 6 Work and Energy There are, however, many cases where the force is not constant. For example, the force exerted by a spring increases the more you stretch the spring. In this lab you will learn how to measure and calculate the work done by any force that acts on a moving object (even a force that changes with time).

Lab 6 - Work and Energy LAB WORK AND ENERGY

Lab 6. Work and Energy Goals •To apply the concept of work to each of the forces acting on an object pulled up an incline at constant speed. •To compare the total work on an object to the change in its kinetic energy as a first step in the application of the so-called Work-Energy Theorem.

Experiment 6: Work and Energy The purpose is to check the work - energy theorem. An air track is tipped by inserting a block of measured thickness under one end. The glider's motion is recorded by a computer attached to a sonic motion sensor, as in the $F = ma$

lab. The results are displayed on a velocity versus position graph. Two points through which the glider moves are chosen.

EXPERIMENT 6: WORK AND ENERGY
Objective: To validate the work-energy theorem and to study the conservation of energy principle. Theory: The work-

energy theorem states that the net (total) work done on a system is equal to its increase in kinetic energy. You will determine the work done on a (nearly) frictionless cart and show that the work done is equal to the increase in kinetic energy of the cart.

EXPERIMENT 6: WORK AND ENERGY

Experiment 6 ~ the Work Energy Theorem. Purpose: The objective of this experiment is to examine the conversion of work into kinetic energy, specifically work done by the force of gravity. The work-kinetic energy theorem equates the net force (gravity, friction, air resistance, etc.) acting on a particle with the kinetic energy gained or lost by that particle.

Experiment 6 ~ the Work Energy Theorem

Definition of work. In Physics, work performed by an object is understood as the amount of energy that needs to be supplied to move by a certain distance. For example, it can be the energy required to carry heavy bags up the stairs or the kinetic energy resulting in the movement of the body. Generally, it is calculated as force multiplied by the displacement an object travels.

Work-energy bar charts are a common tool used in many physics courses. They are a conceptual tool that illustrates what is happening to the total amount of energy possessed by an object. Changes (or lack of changes) in the amount of energy and the form of energy are visually displayed by these charts.

Physics Simulations: Work and Energy

We can say that work is one form of energy. When a force acts from within a

system, energy is removed from the system. One example is stretching a rubber band. When you supply the force to stretch the rubber band, work/energy is added, but when you let go, the internal force of the rubber band contracts and moves the mass, so work/energy is removed from the system.

Work and Energy - 6 Part B: The Work-Energy Theorem In the experiment for part B we used a hanging mass to pull a cart – which caused the cart to accelerate. We used the force sensor to measure the tension in the string and a motion sensor to determine distance traveled (and by consequence the velocity of the cart). We could then deduce

The Work/Energy Equation says "The work done on an object by the net force on it equals the object's change in kinetic energy." or, in symbols: In this lab, you let gravity do work on a

dynamics cart and compare the work done on the cart to the cart's kinetic energy. Here's how it's done. As just mentioned, a hanging mass will be used to supply the force, so if the mass is m , then $F_{\text{net}} = mg$. First, you can start the cart from rest, so that its initial kinetic energy is zero.
