Stoichiometry Mixed Problems

Purpose: In all of the stoichiometry problems so far, students have been given a volume, mass, or amount of one specific substance and asked to solve based on that. This worksheet gives them two measurements. They must determine which of the two is the limiting reagent -- the one that will be used up first in the reaction and will thus determine the amount of product made.

Stoichiometry.Mixed Problems KEY

The masses of each substance taking part in the reaction are always in the same ratio. In general, a chemical equation tells you: how many moles of each substance were involved ; how many grams of each substance were involved. How to calculate a stoichiometry problem? Example: A solution

containing acetic acid is mixed with calcium carbonate.

Stoichiometry (solutions, examples, videos)

Stoichiometry is the measure of the elements within a reaction. X Research source It involves calculations that take into account the masses of reactants and products in a given chemical reaction. Stoichiometry is one half math, one half chemistry, and revolves around the one simple principle above - the principle that matter is never lost or gained during a reaction.

This equation states that 1 iron (Fe) atom will react with two oxygen (O) atoms to yield 2 iron atoms and 3 oxygen atoms. (The subscript number, such as the two in O₂ describe how many atoms of an element are in a molecule.) This unbalanced reaction can't possibly represent a real reaction because it describes a reaction in

which one Fe atom magically becomes two Fe atoms.

The molar concentration (M) of a solution is defined as the number of moles of

solute (n) per liter of solution (i.e, the volume, V solution):

$$M = \frac{n}{V_{\text{solution}}}$$

The units of molarity are mol/L, often abbreviated as M. For example, the number of moles of NaCl in 0.123L of a 1.00M solution of NaCl can be calculated as follows:
