Design Time Ratios Langevin

A design time ratio is the amount of design and development time required for the creation of a unit of seat time (hours to hours, days to days). These are some commonly used ratios: Instructor-led training (ILT) is 45:1; Web-based training (WBT) ranges from 75-500:1; Virtual Classroom (VC) ranges from 25-80:1; If you've tracked design time ratios within your organization, so much the better!

Seat time is the time spent by the learner in a learning environment. For many types of content, elearning clearly offers an advantage. The research generally shows that there is at least a 50% reduction in seat time when a course is converted from classroom learning to elearning. Brandon Hall reports it is a 2:1 ratio.

The Langevin rate coefficient is the theoretical reaction rate coefficient for an ion-molecule process, calculated classically (i.e., neglecting quantum mechanical effects), assuming that reaction occurs upon every collision. The basic principle is that the ion induces a dipole in the (nonpolar) molecule; the theory does not work well for the interaction of an ion and a polar molecule.

This is a solvency ratio, which indicates a firm's ability to pay its long-term debts. The lower the positive ratio is, the more solvent the business. The debt to equity ratio also provides information on the capital structure of a business, the extent to which a firm's capital is financed through debt. This ratio is relevant for all industries.
