The first step in designing a solar PV system is to find out the total power and energy consumption of all loads that need to be supplied by the solar PV system as follows: 1.1 Calculate total Watt-hours per day for each appliance used. Add the Watt-hours needed for all appliances together to get the total Watt-hours per day which

Alright, so we have batteries and we have solar, now we need a way to manage putting the power from the solar into the batteries. An extremely rough calculation to figure out what size solar charge controller you need is to take the watts from the solar, and divide it by the battery bank voltage. Add another 25% for a safety factor.

Solar panel design. Most solar cells are a few square centimetres in area and protected from the environment by a thin coating of glass or transparent plastic. Because a typical 10 cm × 10 cm (4 inch × 4 inch) solar cell generates only about two watts of electrical power (15 to 20 percent of the energy of light incident on their surface), cells are usually combined in series to boost the voltage or in parallel to increase the current.

Power is measured in an instant. Most of the sizing done in solar PV design (conductors, inverters, fuses, etc.) is based on how much power will be passing through a specific component of the system. Because power is measured in an instant, it can vary widely over time and from minute to minute. Power (watts) = current (Amps) X voltage (volts)

Before you start designing a solar power system, you need to take two key points into account: power usage and the usable sun hours that the building receives. The power usage statistic will depend on whether the building is going to be entirely off the grid, or if solar energy is only used to supplement the facility's power supply.
