About Equilibrium Virtual Lab Simulation. Equilibrium describes the state of a reversible reaction, in which the forward and backward reactions happen at equal rates. In this state, the concentrations of reactants and products are stable and do not change over time. Thus, there are no net changes in the concentrations of the reactant (s) and product (s).

When the rate of the forward reaction is equal to the rate of the reverse reaction, the amounts of the chemical species remain constant, and

the system is in a state of equilibrium.

Anything that changes a variable associated with the equilibrium induces a stress on the system. If a stress is applied, the system will shift to accommodate and offset this stress, and a new equilibrium condition will be established.

After a time, a reversible reaction in a closed system can reach what we call a 'dynamic equilibrium'. This is where the forwards reaction (reactants reacting to produce the products) and the backwards reaction (products reacting to reform the reactants) are occurring at the same rate.

Reversible reactions will reach an equilibrium point where the concentrations of the reactants and products will no longer change. A reversible reaction is denoted by a double arrow pointing both directions in a chemical equation. For example, a two reagent, two product equation would be written as. $A + B \rightleftharpoons C + D$.

In principle, all chemical reactions are reversible, but this

reversibility may not be observable if the fraction of products in the equilibrium mixture is very small, or if the reverse reaction is very slow (the chemist's term is "kinetically inhibited")

11.1: Introduction to Chemical Equilibrium - Chemistry ...

Chemical reactions can be reversible at the atomic or molecular level. When opposing processes occur at the same rate, a stable but dynamic state called equilibrium is established. Recall that for a reversible reaction, the equilibrium state is one in which the forward and reverse reaction rates are equal. In the presence of a catalyst, both the forward and reverse reaction rates will speed up equally, thereby allowing the system to reach equilibrium faster.
