Soils, landscapes and biota are arranged and respond to the temporal and spatial distributions of water, nutrients and energy. Landforms (the individual features of the landscape) control the distributions of water, nutrients and energy. Soils must be considered in the context of their landscapes!

Short Notes on Soil (Profile, Texture, Formation and ...

1 Soil is a thin layer of material on the
Earth's surface in which plants have their
roots. It is made up of many things, such
as weathered rock and decayed plant
and animal matter. Soil is formed over a
long period of time. 2 Soil is the
unconsolidated mineral or organic
material on the immediate surface

PRINCIPLES OF SOIL SCIENCE

COMPOST ON THE SOIL IN THE SOIL □
serves as a mulch □ improves soil
quality, soil structure □ prevents
cracking at soil surface □ affects
biological activity □ slows water

movement across the soil surface □
improves nutrient pool □ prevents soil
erosion □ increases availability of
nutrients

Principles of Soil Science - Cornell University

Soils have four major components: (a)
mineral matter, (b) organic matter, (c)
air, and (d) water. Air and water occupy
the pore spaces in soils. Pore spaces are
the voids between the soil particles. Air
and/or water occupy approximately half
the volume of soil.

Edaphology is concerned with the influence of soils on living things, particularly plants. It is one of two main divisions of soil science, the other being pedology. Edaphology includes the study of how soil influences humankind's use of land for plant growth as well as people's overall use of the land. General subfields within edaphology are agricultural soil science and environmental soil science. In Russia, edaphology is considered equivalent to pedology, but is recognized to have an applied
